螺旋爆炸

```
import random
import turtle
import time
def getInteger(tip=''):
   while True:
       try:
           num = int(input(tip))
           return num
       except ValueError:
           print('请输入一个整数')
def getGuessNum(down, up):
   while True:
       quess = getInteger()
       if guess < down or guess > up:
           print('请重新输入一个{}到{}的整数'.format(down, up))
       else:
           return guess
# 游戏进行过程
def playGame():
   # 根据上下限设置随机数字作为炸弹
   print("请设置炸弹的上限和下限")
   downlimit = getInteger('下限为: ')
   while True:
       uplimit = getInteger('上限为: ')
       if uplimit <= downlimit:</pre>
           print('请重新输入一个比下限大的整数作为上限。')
       else:
           break
   bomb = random.randint(downlimit, uplimit)
   print("炸弹已埋下,炸弹在{}到{}之间.....".format(downlimit, uplimit))
   print()
   time.sleep(1)
   # 游戏开始
   print("游戏开始,请输入一个你认为安全的数字:")
   # 判断是否踩到炸弹
   while True:
       guess = getGuessNum(downlimit, uplimit)
       if guess == bomb:
```

```
break
       # 更新炸弹范围
       elif guess < bomb:</pre>
            downlimit = guess
       elif guess > bomb:
           uplimit = guess
       print("炸弹在{}到{}之间".format(downlimit, uplimit))
    print("boom!炸弹爆炸了!")
# 画出螺旋炸弹
def drawBomb(t):
    t.speed(0)
    colors = ["red", "yellow", "blue", "green", "orange"]
    for x in range(50):
       t.pencolor(colors[x % 5])
       t.fillcolor(colors[x % 5])
       t.penup()
       t.forward(x * 3)
       t.pendown()
       t.begin_fill()
       t.circle(1 + x / 5)
       t.end_fill()
       t.left(360 / 5 + 2)
    t.penup()
   t.goto(-140, 100)
    t.pencolor("red")
    t.write("BOOM!!!", font=('微软雅黑', 50, 'bold'))
    t.pendown()
# 主程序
playGame()
t = turtle.Turtle()
drawBomb(t)
input('回车结束程序')
```

比较复杂,让我们一步一步来画

1.turtle 画一个正方形, 看看你们怎么画

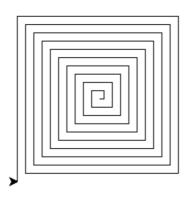

t1.forward(100)

t1.backward(100)

t1.right(90)

t1.left(90)

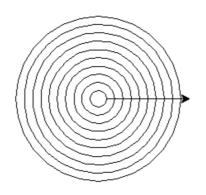

2.螺旋正方形

分析(比较):螺旋正方形与正方形的相同之处与不同之处

提示:

画个年轮

分析:

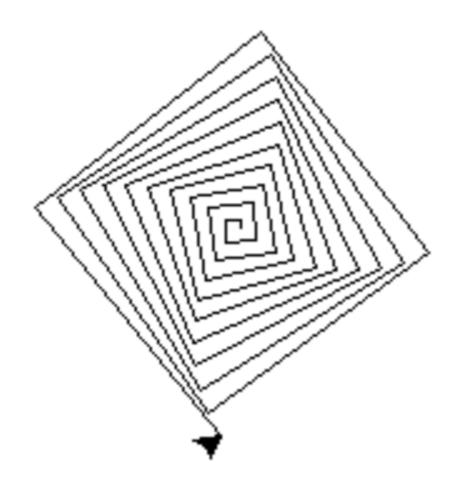

其实就是分析每一个圈的半径

```
k=10
for i in range(0, 10):
    t.left(90)
    t.circle(k*i + k)
    t.right(90)
    t.forward(k)

input()
```

主要想介绍 for in

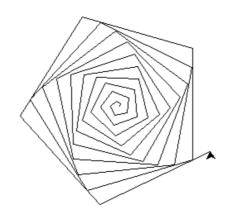

3. 扭曲的螺旋正方形

分析

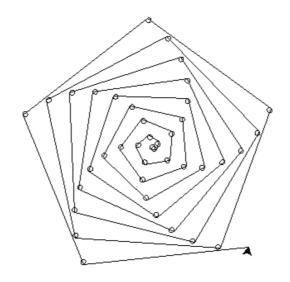

每次的转角变大一点

4.扭曲的螺旋五边形

分析: 四边形转90度, 五边形呢?

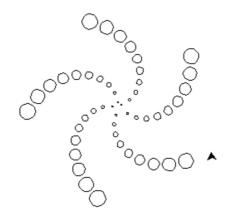

5.简易螺旋爆炸图

每个顶点画半径为2的小圆

去掉边

6.调整圆点大小

7. 上色

分析: 依次画50个点, 这50个点的颜色有没有规律?

```
#列表
能够有序存放多个数据,都能通过下标访问元素。 形式: 中括号 逗号(英文输入法)
colors = ["red", "yellow", "blue", "green", "orange"]
print(colors[0])
print(colors[1])
print(colors[4])
print(colors[-1])
# print(colors[7])
```

```
colors = ["red", "yellow", "blue", "green", "orange"] # 列表
import turtle
def drawBomb(t):
   t.speed(0)
    colors = ["red", "yellow", "blue", "green", "orange"]
    for x in range(50):
        t.pencolor(colors[x % 5])
        t.fillcolor(colors[x % 5])
       t.penup()
        t.forward(x * 3)
       t.pendown()
       t.begin_fill()
       t.circle(1 + x / 5)
       t.end_fill()
       t.left(360 / 5 + 2)
    t.penup()
t = turtle.Turtle()
drawBomb(t)
```

最后

```
t.goto(-140, 100)
t.pencolor("red")
t.write("BOOM!!!", font=('微软雅黑', 50, 'bold'))
t.pendown()
```
